Integration: REST APIs, SOAP, OAuth, SSO, SFTP

Methodologies: Agile, Scrum, BDD

Domain: ERP systems, B2B applications, performance optimization

EDUCATION

University of Wisconsin-Madison – B.S. Computer Science

Dec 2021

3.45 GPA

PROJECTS

Improve platform scalability to handle large data sets (150k line files)

- Overhauled most existing workflows in a multi-month project to support remittance files up to 150k lines, increasing the previous limit from 10k.
- Focused on providing a clean, performant interface so users can meaningfully interact with and view this volume of data. Designed an object-oriented approach to roll out this approach across multiple contexts.

Process EDI 820 files as remittance advices

- Designed and developed a new feature for the cash reconciliation module to read and process the EDI 820 file format for remittance information, while cleaning out legacy code and building in ample configurable options for flexibility.

Florida Crystals, customer management software implementation

- Developed and implemented customer management software for a large grocery sugar business, designing an AI-based system to triage and analyze customer communication.
- Built a tight web service-based integration with the customer's SAP system to let users look up and modify data from our platform in real time. Synthesized calls between multiple databases to automate and streamline data entry as much as possible.
